Cedar Rapids Division | Collins Radio Company, Cedar Rapids, Iowa

312B-4 and 312B-5 Station Controls

Collins Amateur Equipment Guarantee

The Collins Amateur Equipment described herein is sold under the following guarantee:

Collins agrees to repair or replace, without charge, any equipment, parts, or accessories which are defective as to workmanship or materials and which are returned to Collins at its factory or its designated Service Agency, transportation prepared, provided:

- (a) Buyer presents properly executed Warranty Verification Certificate.
- (b) Notice of the claimed defect is given Collins or an authorized Service Agency, or an authorized Distributor, in writing, within 180 days from the date of purchase and goods are returned in accordance with Collins instructions.
- (c) Equipment, accessories, tubes, and batteries not manufactured by Collins or from Collins designs are subject to only such adjustments as Collins may obtain from the supplier thereof.
- (d) Any failure due to use of equipment for purposes other than those contemplated in normal amateur operations or in violation of Collins applicable Instruction Book shall not be deemed a defect within the meaning of these provisions.

This Warranty is void with respect to equipment which is altered, modified or repaired by other than Collins or Collins Authorized Service Agencies. However, alteration or modification in accordance with Collins Service Bulletins shall not affect this Warranty.

Collins reserves the right to make any change in design or to make additions to, or improvements in, Collins products without imposing any obligations upon Collins to install them in previously manufactured Collins products.

No other warranties, expressed or implied, shall be applicable to said equipment, and the foregoing shall constitute the Buyer's sole right and remedy under the agreements contained in these paragraphs. In no event shall Collins have any liability for consequential damages, or for loss, damage or expense directly or indirectly arising from the use of the products, or any inability to use them either separately or in combination with other equipment or materials or from any other cause.

NOTICE: With each equipment or set of equipments purchased, the distributor should furnish a Warranty Verification Certificate. It is necessary that this certificate accompany the equipment when it is returned for warranty repairs. Be sure that you get it from your distributor.

Warranty Repairs

On the opposite page are listed the Service Agencies authorized to perform warranty repair on Collins Amateur Equipments.

If you should wish to return material or equipment direct to Collins under the guarantee, you should notify Collins, giving full particulars including the details listed below, insofar as applicable. If the item is thought to be defective, such notice must give full information as to nature of defect and identification (including part number if possible) of part considered defective. Upon receipt of such notice, Collins will promptly advise you respecting the return. Failure to secure our advice prior to the forwarding of the goods or failure to provide full particulars may cause unnecessary delay in handling of your returned merchandise.

| ADDRESS: | INFORMATION NEEDED: |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Collins Radio Company Amateur Product Office Cedar Rapids, Iowa | (A) Type number, name and serial number of equipment (B) Date of delivery of equipment (C) Date placed in service (D) Number of hours of service (E) Nature of trouble (F) Cause of trouble if known (G) Name of distributor from whom the equipment was purchased. |

Equipment returned to the Service Agency or Collins for warranty repair must be accompanied with the Warranty Verification Certificate.

Out-of-warranty Repair, Modifications, Addition of Accessories, Alignment, etc.:

For information on service of this type write to the address shown below. If you wish to return your equipment for repairs, etc., without prior correspondence, be sure to include the following information attached to the equipment inside the packing carton:

- (1) Complete instructions detailing work to be performed.
- (2) Your return address.
- (3) Method of shipment by which the equipment should be returned.
- (4) Special instructions.

DIRECT YOUR CORRESPONDENCE TO:

Collins Radio Company
Service Repair Department
Third Street Building
Cedar Rapids, Iowa

HOW TO ORDER REPLACEMENT PARTS:

When ordering replacement parts, you should direct your order to one of the listed Collins distributors.

Please furnish the following information insofar as applicable:

INFORMATION NEEDED:

- (A) Quantity required
- (B) Collins part number (9 or 10 digit number) and description
- (C) Item or symbol number obtained from parts list or schematic
- (D) Collins type number, name and serial number of principal equipment
- (E) Unit subassembly number (where applicable)

NOTE: See Distributor List.

INSTRUCTION BOOK

312B-4 AND 312B-5 STATION CONTROLS

523-0179000-003311
3rd EDITION, 15 SEPTEMBER 1962

©**COLLINS RADIO COMPANY**

1961, 1962

CEDAR RAPIDS, IOWA, U.S.A.

PRINTED IN THE UNITED STATES OF AMERICA

1.1 DESCRIPTION.

The 312B-4 and 312B-5 Station Controls contain a directional coupler and wattmeter, a pm speaker, a phone patch, and appropriate switching circuitry. The same types of directional coupler and wattmeter, phone patch, and speaker are used in both the 312B-4 and 312B-5. In addition, the 312B-5 contains a variable frequency oscillator to provide separate transmit and

receive frequencies when used with the KWM-2 or KWM-2A Transceivers.

The wattmeter indicates power levels within the ranges of 0-200 or 0-2000 watts, forward or reflected. It is accurate to within ±5 percent over the range of 2 to 30 mc. The phone patch uses circuitry which allows VOX phone patch operation. It may also be switched manually if desired. The vfo used in the 312B-5 is a 70K-2 Oscillator which is the same as that used in

TABLE 1. ITEMS FURNISHED WITH 312B-4 AND 312B-5

| QUANTITY | DESCRIPTION | FUNCTION | PART NUMBER |
|--------------------|--------------------------------------------|------------------------------------|-------------|
| 1 | Right-angle connector, r-f type N | Antenna connection | 357-9113-00 |
| 1 | RG-58C/U cable with phono and N-connectors | Connect transmitter to coupler | 426-6026-00 |
| 5 | Audio cables with phono connectors | Interconnections | 426-2027-00 |
| 1 | Tubular capacitor, .5 uf, 200 vdc | Install in phone patch if required | 931-0169-00 |
| 1 (312B-5 only) | RG-58C/U cable with phono connectors | External vfo connection | 426-5076-00 |

Figure 1. 312B-5, External Connections

C569-04-P

KWM-2/2A and S-Line equipment. Switching circuits are provided to allow operation of KWM-2/2A Transceivers on different receive and transmit frequencies or transmit-receive operation on the same frequency using either vfo.

Figure 1 shows the location of external connections to the 312B-5. The 312B-4 is similar except for the absence of vfo connections. Items which are furnished with each equipment are listed in table 1.

2.1 INSTALLATION.

2.1.1 312B-4 WITH S-LINE OR KWM-2/2A.

Make phone patch, speaker, and r-f connections to the receiver, exciter, and telephone lines as shown in figure 2. If desired, the directional coupler may be removed from the 312B-4 and mounted elsewhere. Figure 4 shows 312B-4 and KWM-2/2A interconnections. Figure 5 shows the proper way to reconnect the directional coupler to the indicator circuit.

NOTE

If the phone patch is to be used with a receiver other than an S-Line type, connect the ANTI-VOX IN jack on the 312B-4 to a 500-ohm audio output from the receiver. Connect to the

speaker terminals using a 500-ohm-to-voice-coil matching transformer if the receiver has no 500-ohm output. Other types of exciters may be used by connecting the PHONE PATCH OUT jack on the 312B-4 to the exciter microphone jack. The output voltage at this jack on the phone patch is approximately equal to that of the average high-impedance dynamic microphone.

2.1.2 312B-5 WITH KWM-2 OR KWM-2A.

Make power, phone patch, speaker, and r-f connections to the transceiver and telephone lines as shown in figure 3. Use the RG-58C/U cables supplied for the r-f connections. These cables are slightly larger in diameter and two inches shorter than those supplied for audio and control functions.

CAUTION

Make sure the vfo power plug is plugged into the proper socket on the KWM-2/2A chassis. This socket is J17 which, for normal operation, has a molded jumper plug inserted into it.

Figure 2. Interconnections, 312B-4 with S-Line

C352-01-4

3.1 OPERATION.

3.1.1 PHONE PATCH OPERATION: 312B-4 WITH S-LINE.

- If the receiver and exciter are set up for transceiver operation, disconnect the patch cables, and restore to fully independent operation.
- Tune and load the exciter into an antenna or dummy load according to the exciter instruction book.
- Set the receiver to a different band than that being used by the exciter, and tune to the calibrate signal to produce approximately a 900-cps audio tone.
- Lift telephone handset, and dial one number to remove the dial tone.
- Set 312B-4 FUNCTION switch to NORMAL position and PHONE PATCH switch to ON position.
- With the exciter set up for SSB operation, set the VOX GAIN control to the PTT ON position.
- The tone from the receiver will now feed through the phone patch and modulate the transmitter. Using the r-f wattmeter to indicate the magnitude of this

feedthrough, adjust the VOX BAL control for minimum r-f output. As the null is approached, advance the MIC GAIN control as required to produce a suitable indication on the wattmeter.

NOTE

The phone patch will balance on the average telephone line with the circuit capacities provided. Unusual line conditions may require a change in capacity to compensate for these conditions. If necessary, cut C7 loose, or add the extra capacitor (furnished) in parallel with C6 and C7 to produce a null within range of the VOX BAL control.

- Hang up telephone, set PHONE PATCH switch to OFF, and reset transmitter and receiver controls for normal VOX operation. Reconnect patch cables for transceiver operation if desired.
- The phone patch is now ready for use. The normal operating procedure is to call the third party on the

Figure 3. Interconnections, 312B-5 with KWM-2/2A

C487-03-4

C487-45-4

Figure 4. Interconnections, 312B-4 with KWM-2/2A

telephone, then set the PHONE PATCH switch to ON. If received signals are strong, the receiver RF GAIN may be reduced to minimize background noise. Adjust AF GAIN to provide normal telephone line level.

j. Depending upon telephone line characteristics and the voice volume of the incoming telephone signal, it may be necessary to make slight adjustments of transmitter MIC GAIN and VOX GAIN controls. In the case of extremely weak signals from the telephone line, use push-to-talk operation.

3.1.2 PHONE PATCH OPERATION: 312B-4/5 WITH KWM-2 OR KWM-2A.

a. Set EMISSION switch to LSB, ANTIVOX GAIN at minimum, MIC GAIN at minimum, VOX GAIN at minimum, and RF GAIN and AF GAIN as required for normal operation.

b. Set function switch to CAL, and tune in the calibrate signal to produce approximately a 900-cps audio tone.

c. Set VOX BAL control on 312B-4/5 to full counter-clockwise.

d. Lift telephone handset, and dial a single digit to remove dial tone.

e. Set PHONE PATCH switch to ON.

f. Advance VOX GAIN control on the transceiver until the VOX relays begin to trip back and forth between receive and transmit positions.

g. Slowly adjust VOX BAL control until the relays stop tripping.

h. Repeat steps f and g until it is no longer possible to advance the VOX GAIN control without causing the relays to trip. (If phone patch will not balance, refer to note accompanying step g of paragraph 3.1.1.)

NOTE

More precise balancing may be obtained if an a-c vtv is used. Connect the vtv from the PHONE PATCH OUT jack (J4 on 312B-5) to ground. Slowly adjust the VOX BAL control for a null as indicated by the vtv.

i. Hang up telephone, turn off phone patch, and reset all transceiver controls for normal VOX SSB operation.

j. The phone patch is now ready for use. Normal procedure is to set PHONE PATCH switch to ST'N MUTE and call the third party on the telephone. Switch the phone patch on and adjust AF GAIN on the transceiver to provide normal telephone line level. If

Figure 5. Wattmeter Interconnections

C487-08-4

Figure 6. VSWR Graph for Forward Vs Reflected Power

C189-01-1X

received signal is strong, the RF GAIN may be decreased to reduce background noise.

k. Depending upon telephone line characteristics and voice volume of the incoming telephone signal, it may be necessary to make slight adjustments of MIC GAIN and VOX GAIN. In case of extremely weak signals from the telephone line, manually switch the phone patch back and forth from REC ONLY to XMIT ONLY.

3.1.3 OPERATION OF DIRECTIONAL COUPLER AND WATTMETER.

The transmitter output power that can be handled safely is relative to the swr on the transmission line. If the swr is extremely high, as when the line is open or shorted, it is possible to obtain a forward power indication of up to two kilowatts with very little power output from the transmitter. To avoid damage to the instrument, carefully observe the following operating procedure:

a. Set the wattmeter switch to the FORWARD 200 position. (If a linear amplifier is being used, set switch to FORWARD 2000 position.)

b. Couple r-f into the transmission line using CW emission. The meter should show a forward power indication. Note the reading.

c. Switch to the appropriate REFLECTED scale. Unless the antenna or load is perfectly matched to the transmission line (52 ohms, resistive), the meter will indicate reflected power. Note the reading.

d. The forward and reflected power readings, in conjunction with the chart of figure 6, may be used to compute vswr. In some cases, it may be convenient to multiply the forward and reflected power readings by a factor of 10. The method of reading swr from the chart remains the same. For example, 50 watts forward and 5 watts reflected result in a

value of swr slightly less than 2 to 1. Power levels of 500 watts forward and 50 watts reflected produce the same value of swr.

CAUTION

In applications where doubt exists in regard to expected power output from the transmitter, always select the highest wattmeter scale first and, if necessary, switch to the lower scale. This will prevent damage to the indicator.

If the reflected power indication is greater than the forward power indication, it is probable that the coupler unit has been improperly installed. Check to make sure that the coupler has not been installed backwards in the transmission line. Also make sure that the d-c meter leads have not been reversed.

e. If forward and reflected power indications are equal, or reflected power is nearly equal to forward power, the swr on the line is extremely high. This usually indicates a shorted, open, or very poorly terminated line. The coupler will respond to harmonic and other spurious output as well as to r-f output at the desired frequency. If the transmitter output contains a high level of spurious emission, a high swr indication may be obtained even if the transmission line is terminated properly.

3.1.4 OPERATION OF STATION CONTROL SWITCHES.

Table 2 lists operating conditions for the various settings of FUNCTION and PHONE PATCH switches in 312B-4 and 312B-5 Station Controls.

TABLE 2. OPERATION OF PHONE PATCH AND FUNCTION SWITCHES

| FUNCTION SWITCH POSITIONS | PHONE PATCH SWITCH POSITIONS | | |
|---------------------------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| | ON | OFF | STATION MUTE |
| NORMAL | Speaker dead, MIC dead, PTT operative, VOX operative, patch connected. | Speaker live, MIC live, PTT operative, VOX operative, patch disconnected. | Speaker dead, MIC dead, transmitter input grounded*, PTT inoperative. |
| RECEIVE ONLY | Speaker dead, transmitter input grounded*, PTT inoperative, MIC dead, patch hears receiver. | Speaker live, PTT inoperative, transmitter input grounded*, patch disconnected. | Same as above. |
| TRANSMIT ONLY | Speaker dead, PTT operative, MIC dead, anti-vox voltage grounded. | Speaker dead, PTT operative, MIC live, anti-vox voltage grounded. | Same as above. |

*PHONE PATCH OUT jack (J4) shorted.

3.1.5 OPERATION OF VFO IN 312B-5.

The switch positions of the VFO switch designate the two oscillators as number 1 and 2. Number 1 is the vfo in the KWM-2 (or KWM-2A). Number 2 is the vfo in the 312B-5. The vfo switching arrangement allows tuning the receiver circuits into the foreign d-x band while keeping the transmitter frequency in the American portion of the band, instant selection of either of two preset frequencies within the American band (one for net frequency and one for net QSY frequency), scanning for a clear channel in case of severe interference, and checking the local transmitter frequency for interference while working d-x.

a. With VFO selector switch in the REC 1 - XMIT 2 position, the receiver frequency is controlled by the dial setting of the KWM-2/2A, and the transmitter frequency is controlled by the dial setting of the 312B-5. This allows the transmit circuits to be set within the American portion of the band and the receive circuits to be tuned into the d-x band. For example, with the 312B-5 dial set to 14.296 mc and the EMISSION switch on the KWM-2/2A set to TUNE, the transmit circuits may be peaked and the PA loaded. The EMISSION switch is then set back to the desired sideband or CW and the KWM-2/2A dial tuned to a desired receiving frequency between 14.3 and 14.350 mc. Refer to table 3.

TABLE 3
KWM-2/2A AND 312B-5 APPROXIMATE
VFO FREQUENCY SEPARATION LIMITS

| | BANDS (MC) | | | | |
|-------------------------------------------------------------------|------------|-------|---------|---------|--------|
| | 3.4-4 | 7-7.4 | 14-14.4 | 21-21.6 | 28-30 |
| Approximate limit of separation between 312B-5 and KWM-2/2A dials | 15 kc | 30 kc | 50 kc | 75 kc | 100 kc |

b. With the VFO selector switch in the REC 1 - XMIT 1 position, both the receiver and transmitter frequencies are the same and are controlled by the vfo in the transceiver.

c. With the VFO selector switch in the REC 2 - XMIT 2 position, both the receiver and the transmitter frequencies are the same and are controlled by the vfo in the 312B-5. The vfo dial in the 312B-5 can be calibrated in this position using the crystal calibrator signal and zero set knob as outlined in the KWM-2/2A instruction book. With the 312B-5 VFO switch set in REC 1 - XMIT 1 position, the KWM-2/2A may be tuned and loaded to one selected frequency within the legal

amateur band using the KWM-2/2A tuning dial. The VFO switch may then be changed to REC 2 - XMIT 2 position, and the 312B-5 dial adjusted to another selected frequency within the same band. Transceiver operation may then be changed instantly from one frequency to the other by operating the VFO switch on the 312B-5 back and forth between the two positions marked REC 1 - XMIT 1 and REC 2 - XMIT 2. This permits presetting to a net frequency and a net QSY frequency, and the instant selection of either during net operation. Frequency separation limits listed in table 1 should not be exceeded by any great extent. If they are exceeded, the result is decreased receiver sensitivity or transmitter PA grid drive (or both) due to the selectivity of the transceiver r-f tuned circuits. The best compromise for this tuned circuit attenuation effect is to tune and load the KWM-2/2A at a frequency midway between the two desired frequencies and then set the 312B-5 and KWM-2/2A dials to the required frequencies.

4.1 MAINTENANCE.

4.1.1 GENERAL.

If excessive oscillator drift is experienced, replace V301. The oscillator tube V301 can be replaced without upsetting the calibration accuracy of the oscillator.

For repairs which will affect the calibration of the directional coupler, it is recommended that the unit be returned to the factory or a Collins Authorized Service Agency. Laboratory instruments are used to assure accurate calibration.

4.1.2 VFO DIAL CALIBRATION.

The vfo alignment in the 312B-5 can be adjusted to coincide at the end points (0 and 200) with the vfo in the KWM-2/2A. If necessary, align the vfo in the KWM-2/2A before proceeding with the 312B-5 alignment. Refer to the Service Instructions section in the transceiver instruction book. Align the vfo in the 312B-5 as follows:

- a. Set VFO switch on 312B-5 to REC 1 - XMIT 1 position and FUNCTION switch to NORM.
- b. Tune to zero beat with calibrate signal at 200 end of KWM-2/2A dial.
- c. Set VFO switch on 312B-5 to REC 2 - XMIT 2 position.
- d. Tune vfo in 312B-5 to zero beat at 200 end of dial, and set hairline to 200 with zero set knob.
- e. Repeat steps a, b, and c at 0 end of dial in KWM-2/2A.
- f. Tune vfo in 312B-5 to zero beat at 0 end of dial. Do not move the hairline. Zero beat should occur within ± 1 kc of 0 on the 312B-5 dial.
- g. If zero beat does not occur within the limits stated in step f, reduce the end-point spread by adjusting L302 as outlined in the KWM-2/2A Instruction Book.
- h. If necessary, loosen the setscrews in the 312B-5 dial hub, and move the dial relative to the oscillator

shaft so that the hairline is approximately vertical when the dial is calibrated.

i. Recheck for end-point spread, and make minor adjustment, if required.

j. Make the sideband frequency shift adjustment as outlined in paragraph 4.1.3.

4.1.3 VFO SIDEBAND FREQUENCY SHIFT ADJUSTMENT.

a. Set controls of 312B-5 as follows: VFO selector to REC 2 - XMIT 2, FUNCTION selector to NORM.

b. Set controls of KWM-2/2A as follows: BAND switch to 3.6, EXCITER TUNING to approximately 1.9 on logging scale, EMISSION switch to LSB, and OFF-ON-NB-CAL switch to CAL position. Tune dial near 100 until calibrate signal is zero beat. Do not move dial for following procedure.

c. Switch to USB, and adjust trimmer C308 (top of vfo can in 312B-5) for zero beat.

5.1 SPECIFICATIONS.

5.1.1 DIRECTIONAL COUPLER AND WATTMETER.

Frequency range 2 to 30 mc

Impedance 52 ohms unbalanced

Wattmeter scales
200 watts, forward
2000 watts, forward
200 watts, reflected
2000 watts, reflected

Maximum power handling capability 2000 watts forward power

Power loss through coupler Less than 0.1 percent

Swr introduced by coupler Less than 1.05:1

5.1.2 PHONE PATCH.

Input impedance 600 ohms

Output impedance 600 ohms

5.1.3 PM SPEAKER.

Impedance 3 to 4 ohms

Size 5 by 7 inches

5.1.4 VFO IN 312B-5.

Frequency range 2.5 to 2.7 mc

Calibration accuracy . . . Within 1 kc

Drift Less than 100 cps after 30-minute warmup

Dial backlash Less than 50 cps

Power Supplied by KWM-2 or KWM-2A transceiver

| R | Polyvinyl Chloride, MIL-W-16878, Type C (1000 Volts) | | | | | | |
| S | Not Available | | | | | | |
| T | Teflon (TFE), MIL-W-16878, Type E (600 Volts) Stranded | | | | | | |
| U | Not Available | | | | | | |
| V | Polyvinyl Chloride, MIL-W-16878, Type D (3000 Volts) | | | | | | |
| W | Teflon (TFE), MIL-W-16878, Type EE (1000 Volts) | | | | | | |
| X | Teflon (TFE), MIL-W-16878, Type ET (250 Volts) | | | | | | |
| X2 | Teflon (FEP), MIL-W-16878, Type K (600 Volts) | | | | | | |
| X3 | Teflon (FEP), MIL-W-16878, Type KT (250 Volts) | | | | | | |
| X4 | Teflon (TFE), Non-MIL (3000 Volts) | | | | | | |
| Y | Telephone Type, Polyvinyl | | | | | | |
| Y1 | Teflon (TFE), Non-MIL; Solid Conductor | | | | | | |
| Z | Telephone Type, Braided Yarn | | | | | | |

Note 1 - Extruded nylon over fiber glass braid.

Note 2 - Braided, lacquered nylon over fiber glass braid.

Note 3 - Extruded nylon over secondary vinyl over fiber glass over primary vinyl.

Note 4 - Lacquered extruded nylon over secondary vinyl over fiber glass over primary vinyl.
